# Attack Triggering – Battery Level Inference

RQ1: Do different power banks present different battery levels in a wireless charging process?

# Attack Triggering – Battery Level Inference

**RQ1: Do different power banks present different battery levels in a wireless charging process?**

**Answer to RQ1:** Different power banks present different charging patterns, and some (e.g., EGO MAGPOWER 2, Anker MagGo) present ladder-like battery levels.

# Attack Triggering – Battery Level Inference

RQ2: Does the initial battery percentage of the smartphone impacts the inductive charging current?

# Attack Triggering – Battery Level Inference

**RQ2: Does the initial battery percentage of the smartphone impacts the inductive charging current?**

**Answer to RQ2:** The inductive charging current in the secondary coil depends on the battery level of the power bank regardless of the smartphone's initial battery percentage.

# Attack Triggering – Battery Level Inference

RQ3: Can CDFs of magnetic field strength differences distinguish the battery levels of a power bank?

# Attack Triggering – Battery Level Inference

RQ3: Can CDFs of magnetic field strength differences distinguish the battery levels of a power bank?

Answer to RQ3: We can use CDFs of the magnetic field strength differences as the measurement to distribute different battery levels of a wireless charging power bank.

$$Mag_s(t) = \sqrt{Mag_x^2(t) + Mag_y^2(t) + Mag_z^2(t)}$$

(a) EGO MAGPOWER 2.

(b) Anker MagGo.

# Attack Triggering – Battery Level Inference

RQ3: Can CDFs of magnetic field strength differences distinguish the battery levels of a power bank?

Answer to RQ3: We can use CDFs of the magnetic field strength differences as the measurement to distribute different battery levels of a wireless charging power bank.

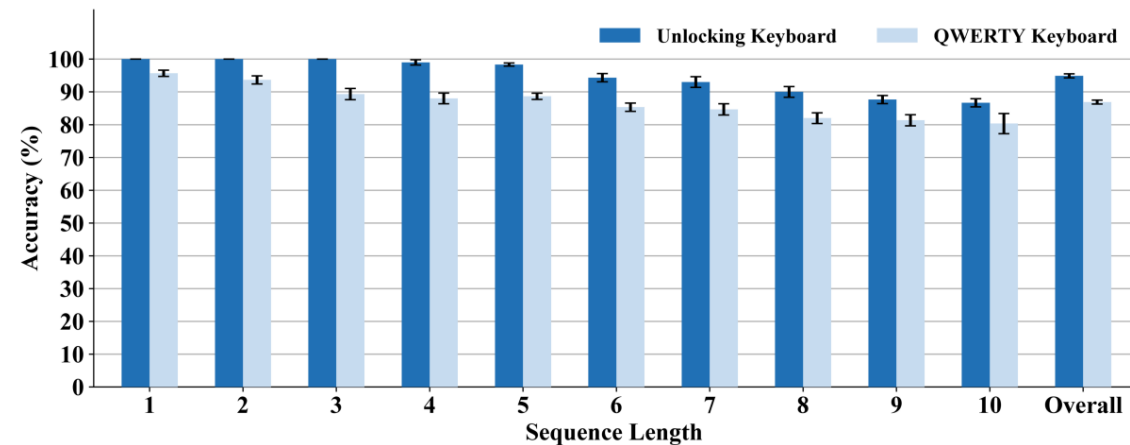

$$Mag_s(t) = \sqrt{Mag_x^2(t) + Mag_y^2(t) + Mag_z^2(t)}$$

# Few-Shot Learning – Fast Adaptation

---

## Algorithm 1: Meta-training for magnetic classifier

---

**Input:**  $\mathcal{D}_S$ : source dataset.  $f$ : magnetic signal classifier.  $\alpha$  and  $\beta$ : learning rate hyperparameters.  
**Output:**  $f_{\theta^*}$ : trained magnetic signal classifier with optimized parameters  $\theta^*$ .

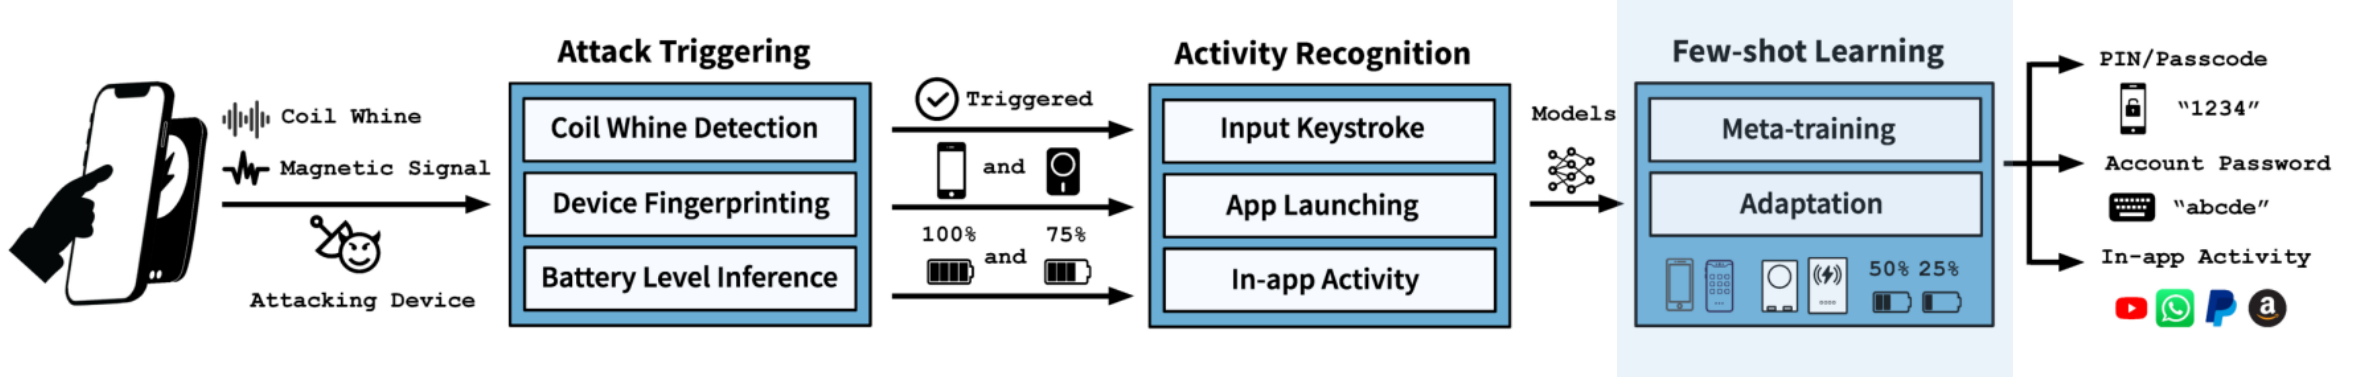

```

1  $\theta \leftarrow \theta_0, f_{\theta} \leftarrow f_{\theta_0}$   $\triangleright$  random initialize  $f_{\theta}$  with parameters  $\theta_0$ 
2 while not finished do
3    $\mathcal{T} \leftarrow$  generate a batch of tasks from  $\mathcal{D}_S$ 
4   for each task  $\mathcal{T}_i \in \mathcal{T}$  do
5      $\mathcal{S}_{\mathcal{T}_i} \leftarrow K \times N$  support samples from  $\mathcal{T}_i$ 
6      $\mathcal{S}_{\mathcal{Q}_i} \leftarrow K \times N$  query samples from  $\mathcal{T}_i$ 
7      $(\mathcal{S}_{\mathcal{T}_i} \cap \mathcal{S}_{\mathcal{Q}_i} = \phi)$ 
8     Evaluate  $\nabla_{\theta} \mathcal{L}_{\mathcal{T}_i}(f_{\theta})$  with  $\mathcal{S}_{\mathcal{T}_i}$  and loss  $\mathcal{L}_{\mathcal{T}_i}(f_{\theta}, \mathcal{S}_{\mathcal{T}_i})$ 
9      $\theta'_{\mathcal{T}_i} \leftarrow \theta_0 - \alpha \nabla_{\theta} \mathcal{L}_{\mathcal{T}_i}(f_{\theta_0}, \mathcal{S}_{\mathcal{T}_i})$   $\triangleright$  obtain task-specific
       parameters  $\theta'_{\mathcal{T}_i}$  of  $\mathcal{T}_i$  using gradient descent.
10    Evaluate  $\mathcal{L}_{\mathcal{T}_i}(f_{\theta'_{\mathcal{T}_i}})$  with query set  $\mathcal{S}_{\mathcal{Q}_i}$ .
11   $\theta^* \leftarrow \theta_0 - \beta \nabla_{\theta} \sum_{\mathcal{T}_i \in \mathcal{T}} \mathcal{L}_{\mathcal{T}_i}(f_{\theta'_{\mathcal{T}_i}}, \mathcal{S}_{\mathcal{Q}_i})$   $\triangleright$  obtain the
    optimized parameters  $\theta^*$  that minimizes all task losses
12 Output classifier  $f_{\theta^*}$  with optimized parameters  $\theta^*$ 

```
